

## **Advance Your Business... Increase Your ROI... Stay Ahead of the Pack**

Our "disruptive" technology is designed with the OEM manufacturer in mind. OEMs looking for unique appliance solutions work with NextComputing for a variety of reasons. Our technical expertise offers OEM customers huge upsides and allows them to beat their competition to market, deliver cutting-edge solutions, tackle new business segments, and uncover new revenue channels from sales to support.

Eliminating the need for huge R&D investments and related "sunk costs," our open-standards, common chip-set approach enables companies to bundle leading technology in the industry's leading high-performance mobile hardware. OEMs use our base systems as platforms to expand and integrate product lines to create significant incremental business and improve the customer experience. Similarly, OEMs can introduce entirely new service models to the field, while solving the most pressing problems facing the end-user community.

NextComputing configures custom systems to optimize everything from software to peripheral devices and provide our OEM base with the ultimate in flexibility and design control. The scalable nature of the hardware ensures system viability for years to come and provides up-sell opportunities with regard to PCIe cards and 64-bit software.

NextComputing's own internal business model is set up to accommodate custom casings for private label opportunities, with advantages such as full integration and "drop-ship" programs out of our US-based manufacturing plant.

Leverage NextComputing's leading-edge technology to create entirely new streams of revenue, first-to-market custom solutions, incremental product lines, and more. Contact us to learn more about ways in which we can work together to "change the game."
